

MT Natural Composite Propellers credited for saving lives.

Cessna 340. Gear up in landing. Go around initiated on instinct when props hit. Pilot climbed to safe altitude and was required to circle the area for 15 minutes to allow ATC to clear traffic and debris from the runways (large international airport). After 15 minutes, a normal landing was made. Pilot indicated amazement at the lack of vibration and continued thrust observed after the props were sheared. He was quoted as saying: "Those MT props just saved my life."

The pilot of this DA-42 was going to do a touch-n-go. At the last minute the pilot realized he forgot the landing gear. The pilot quickly added power and flew back to his home airport. The pictures are what was left of his MT Propellers at shutdown. Nearly half the blade is missing and this airplane still flew for almost 30 minutes! The pilot had no idea what had happened to the propellers until he shut down.
